Clinically proven to reduce the appearance of scars

Silgel™ is a topical silicone gel that is used to reduce the visibility of scars resulting from surgery, burns and other injuries.

Studies prove silicone gel to be effective in the management of scars1,2.

- Proven to be more effective than other treatments at improving scars.
- Softens, flattens & smoothes.

How Silgel™ works to help patients say goodbye to scars

Silgel™ is used for the management of keloid and hypertrophic scars and associated erythema. The following steps highlight how Silgel works.

Step one
- Apply a thin layer of Silgel over the affected area 1 or 2 times a day.
- Not to be used on open wounds.

Step two
- The non-sticky formula dries quickly and helps retain the skin’s moisture.

Step three
- The silicone forms a waterproof, breathable barrier that helps protect the scarred tissue from bacteria.
- For optimum results use for a minimum of four months.

Key benefits of Silgel3:
- Flattens the appearance of the scar.
- Fades the colouration of the scar.
- Changes the consistency of the scar to produce softer tissue.
- Can eliminate itchiness of scars.

Before and after Silgel

- Before: Broad, bulging scar on forehead after secondary intention wound healing following excision of a tumour.
- After: Result after 4 months’ continuous use of Silgel. Clear visible improvement.

- Before: Bulging, thick, red and itching scar after scaling.
- After: Result after 9 months’ continuous use of Silgel. Clear visible improvement.
